

## Day 6: Automated dictionary-based approaches

Kenneth Benoit

Essex Summer School 2013

July 29, 2013

## Rationale for dictionaries

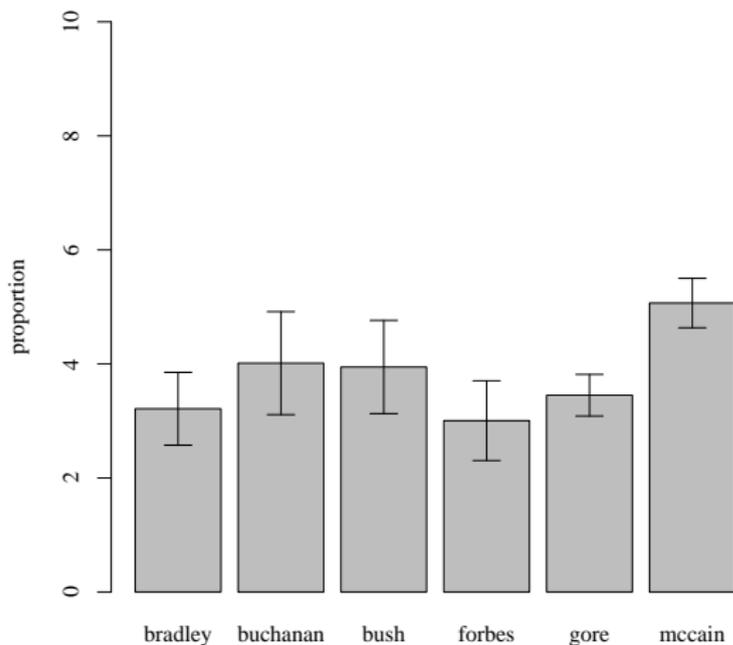

- ▶ Rather than count words that occur, pre-define words associated with specific meanings
- ▶ Another move toward the fully automated end of the text analysis spectrum, since involves no human decision making as part of the text analysis procedure
- ▶ Frequently involves lemmatization: transformation of all inflected word forms to their “dictionary look-up form” — more powerful than stemming
- ▶ Example: General Inquirer codes *I*, *me*, *my*, *mine*, *myself* as *self*, and *we*, *us*, *our*, *ours*, *ourselves* as *selves*

## Well-known dictionaries: General Inquirer

- ▶ General Inquirer (Stone et al 1966)
- ▶ Maps texts to counts from an extensive dictionary
- ▶ Latest version contains 182 categories – the "Harvard IV-4" dictionary, the "Lasswell" dictionary, and five categories based on the social cognition work of Semin and Fiedler
- ▶ Examples: "self references", containing mostly pronouns; "negatives", the largest category with 2291 entries
- ▶ Uses stemming
- ▶ Also uses **disambiguation**, for example to distinguishes between *race* as a contest, *race* as moving rapidly, *race* as a group of people of common descent, and *race* in the idiom "rat race"
- ▶ Output example: `http://www.wjh.harvard.edu/~inquirer/Spreadsheet.html`

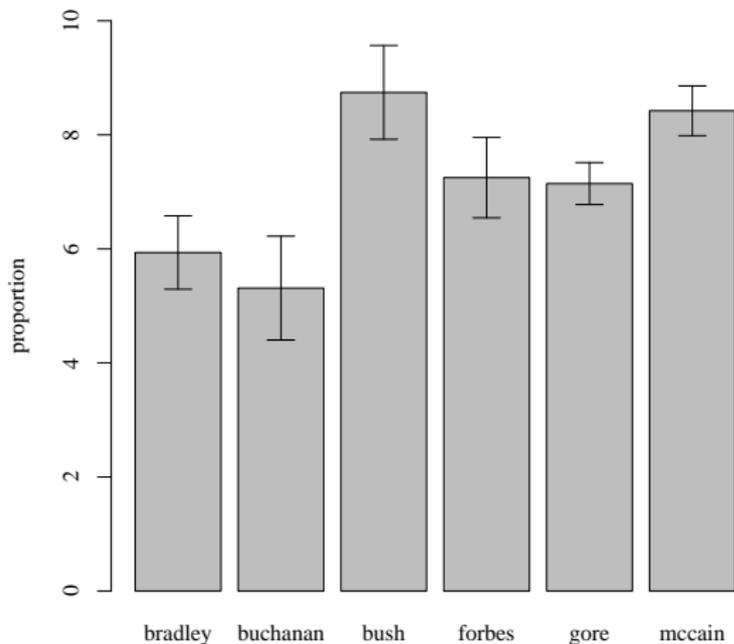

# General Inquirer Applied to US Presidential Candidate Speeches (2000)

Negative language

# General Inquirer Applied to US Presidential Candidate Speeches (2000)

Positive language

## Well-known dictionaries: Regressive Imagery Dictionary

- ▶ Consists of about 3,200 words and roots, assigned to 29 categories of primary process cognition, 7 categories of secondary process cognition, and 7 categories of emotions
- ▶ designed to measure primordial vs. conceptual thinking
  - ▶ **Conceptual thought** is abstract, logical, reality oriented, and aimed at problem solving
  - ▶ **Primordial thought** is associative, concrete, and takes little account of reality – the type of thinking found in fantasy, reverie, and dreams
- ▶ Categories were derived from the theoretical and empirical literature on regressive thought by Martindale (1975, 1990)

# Regressive Imagery Dictionary categories

## ► Full listing of categories

1 orality	21 brink-passage	41 aggression	62 novelty
2 anality	22 narcissism	42 expressive behaviour	63 negation
3 sex	23 concreteness	43 glory	64 triviality
4 touch	24 ascend	44 female role	65 transmute
5 taste	25 height	45 male role	
6 odour	26 descent	46 self	
7 general sensation	27 depth	47 related others	
8 sound	28 fire	48 diabolic	
9 vision	29 water	49 aspiration	
10 cold	30 abstract thought	50 angelic	
11 hard	31 social behaviour	51 flowers	
12 soft	32 instrumental behaviour	52 synthesize	
13 passivity	33 restraint	53 streight	
14 voyage	34 order	54 weakness	
15 random movement	35 temporal references	55 good	
16 diffusion	36 moral imperative	56 bad	
17 chaos	37 positive affect	57 activity	
18 unknown	38 anxiety	58 being	
19 timelessness	39 sadness	59 analogy	
20 counscious	40 affection	61 integrative con	

## ► More on categories:

<http://www.kovcomp.co.uk/wordstat/RID.html>

## Linguistic Inquiry and Word Count

- ▶ Created by Pennebaker et al — see <http://www.liwc.net>
- ▶ uses a dictionary to calculate the percentage of words in the text that match each of up to 82 language dimensions
- ▶ Consists of about 4,500 words and word stems, each defining one or more word categories or subdictionaries
- ▶ For example, the word *cried* is part of five word categories: sadness, negative emotion, overall affect, verb, and past tense verb. So observing the token *cried* causes each of these five subdictionary scale scores to be incremented
- ▶ Hierarchical: so “anger” are part of an *emotion* category and a *negative emotion* subcategory
- ▶ Exact dictionary is proprietary (e.g. *secret*) but you can view a summary here:  
<http://www.liwc.net/descriptiontable1.php>

## Example: Terrorist speech

	Bin Ladin (1988 to 2006) N = 28	Zawahiri (2003 to 2006) N = 15	Controls N = 17	p (two- tailed)
Word Count	2511.5	1996.4	4767.5	
Big words (greater than 6 letters)	21.2a	23.6b	21.1a	.05
Pronouns	9.15ab	9.83b	8.16a	.09
I (e.g. I, me, my)	0.61	0.90	0.83	
We (e.g. we, our, us)	1.94	1.79	1.95	
You (e.g. you, your, yours)	1.73	1.69	0.87	
He/she (e.g. he, hers, they)	1.42	1.42	1.37	
They (e.g., they, them)	2.17a	2.29a	1.43b	.03
Prepositions	14.8	14.7	15.0	
Articles (e.g. a, an, the)	9.07	8.53	9.19	
Exclusive Words (but, exclude)	2.72	2.62	3.17	
Affect	5.13a	5.12a	3.91b	.01
Positive emotion (happy, joy, love)	2.57a	2.83a	2.03b	.01
Negative emotion (awful, cry, hate)	2.52a	2.28ab	1.87b	.03
Anger words (hate, kill)	1.49a	1.32a	0.89b	.01
Cognitive Mechanisms	4.43	4.56	4.86	
Time (clock, hour)	2.40b	1.89a	2.69b	.01
Past tense verbs	2.21a	1.63a	2.94b	.01
Social Processes	11.4a	10.7ab	9.29b	.04
Humans (e.g. child, people, selves)	0.95ab	0.52a	1.12b	.05
Family (mother, father)	0.46ab	0.52a	0.25b	.08
Content				
Death (e.g. dead, killing, murder)	0.55	0.47	0.64	
Achievement	0.94	0.89	0.81	
Money (e.g. buy, economy, wealth)	0.34	0.38	0.58	
Religion (e.g. faith, Jew, sacred)	2.41	1.84	1.89	

Note. Numbers are mean percentages of total words per text file. Statistical tests are between Bin Ladin, Zawahiri, and Controls. Documents whose source indicates "Both" (n=3) or "Unknown" (n=2) were excluded due to their small sample sizes.

## Example: Laver and Garry (2000)

- ▶ A *hierarchical* set of categories to distinguish policy domains and policy positions – similar in spirit to the CMP
- ▶ Five domains at the top level of hierarchy
  - ▶ economy
  - ▶ political system
  - ▶ social system
  - ▶ external relations
  - ▶ a “ ‘general’ domain that has to do with the cut and thrust of specific party competition as well as uncodable pap and waffle”
- ▶ Looked for word occurrences within “word strings with an average length of ten words”
- ▶ Built the dictionary on a set of specific UK manifestos

# Example: Laver and Garry (2000): Economy

**TABLE 1** Abridged Section of Revised Manifesto Coding Scheme

---

1	ECONOMY
	Role of state in economy
1	ECONOMY/+State+
	Increase role of state
1 1	ECONOMY/+State+/Budget
	Budget
1 1 1	ECONOMY/+State+/Budget/Spending
	Increase public spending
1 1 1 1	ECONOMY/+State+/Budget/Spending/Health
1 1 1 2	ECONOMY/+State+/Budget/Spending/Educ. and training
1 1 1 3	ECONOMY/+State+/Budget/Spending/Housing
1 1 1 4	ECONOMY/+State+/Budget/Spending/Transport
1 1 1 5	ECONOMY/+State+/Budget/Spending/Infrastructure
1 1 1 6	ECONOMY/+State+/Budget/Spending/Welfare
1 1 1 7	ECONOMY/+State+/Budget/Spending/Police
1 1 1 8	ECONOMY/+State+/Budget/Spending/Defense
1 1 1 9	ECONOMY/+State+/Budget/Spending/Culture
1 1 1 2	ECONOMY/+State+/Budget/Taxes
	Increase taxes
1 1 1 2 1	ECONOMY/+State+/Budget/Taxes/Income
1 1 1 2 2	ECONOMY/+State+/Budget/Taxes/Payroll
1 1 1 2 3	ECONOMY/+State+/Budget/Taxes/Company
1 1 1 2 4	ECONOMY/+State+/Budget/Taxes/Sales
1 1 1 2 5	ECONOMY/+State+/Budget/Taxes/Capital
1 1 1 2 6	ECONOMY/+State+/Budget/Taxes/Capital gains
1 1 1 3	ECONOMY/+State+/Budget/Deficit
	Increase budget deficit
1 1 1 3 1	ECONOMY/+State+/Budget/Deficit/Borrow
1 1 1 3 2	ECONOMY/+State+/Budget/Deficit/Inflation

---

## Example: Laver and Garry (2000)

ECONOMY / +STATE  
accommodation  
age  
ambulance  
assist  
...

ECONOMY / -STATE  
choice\*  
compet\*  
constrain\*  
...

## How to build a dictionary

- ▶ The ideal content analysis dictionary associates all and only the relevant words to each category in a perfectly valid scheme
- ▶ Three key issues:
  - Validity      Is the dictionary's category scheme valid?
  - Sensitivity    Does this dictionary identify *all* my content?
  - Specificity    Does it identify *only* my content?

## How to build a dictionary

Assume you want to construct an entry for the category 'Terrorism'  
Imagine two different dictionary entries:

- ▶ One contains all the words in the language (D1)
- ▶ The other contains the word 'terrorist' (D2)

D1 is *highly sensitive*: no language about terrorism is ever missed,  
but *highly unspecific*: terrorism language is swamped

D2 is *highly specific*: the word occurs in discussions of terrorism,  
but *highly insensitive*: much terrorism language is ignored

Of course, useful dictionaries lie in the middle

## How to build a dictionary

Different problems arise with more than one category, e.g.

- ▶ 'Agricultural policy' vs 'National security'

Even if the categories *themselves* are exclusive there is always a chance a *word* suitable for one slips into the other category,  
Or there are words that are used to describe both topics, e.g.

- ▶ 'revolution', 'outbreak', 'quarantine'

That is a fact not easily dealt with by CCA. An explicitly statistical framework is needed.

# Coding scheme fundamentals

1. First key principle: Hierarchy
  - 1.1 First level: Domain
  - 1.2 Second level: subdomain
  - 1.3 (Third+ levels: may be additional sub-domains)
2. Second key principle: Confrontation  
Lowest-level categories should be for/against pairs, or “for/neutral/against”
3. On testing: Not necessary at design stage in the same way as for human coding – this is replaced by sensitivity/specificity testing in dictionary construction

# How to build a dictionary

1. Identify “extreme texts” with “known” positions. Examples:
  - ▶ Opposition leader and Prime Minister in a no-confidence debate
  - ▶ Opposition leader and Finance Minister in a budget debate
  - ▶ Five-star review of a product (excellent) and a one-star review (terrible)
2. Search for differentially occurring words using word frequencies
3. Examine these words in context to check their sensitivity and specificity
4. Examine inflected forms to see whether stemming or wildcarding is required
5. Use these words (or their lemmas) for categories
